## MARANDA HIGH SCHOOL KCSE TRIAL AND PRACTICE EXAM 2016

### QUESTION PAPER 2

### MARKING SCHEME

1. a) Is a solution in which no more solute can dissolve at that given temperature  
b) i) - (Fractional) Distillation  
ii) - It has high specific heat capacity  
- It has the highest boiling point  
iii) This is because it has got lower boiling point  
c) i) Heat the mixture, Ammonia chloride  
Sublimes, Add water to the remaining mixture, and filter out lead II chloride as the residue then evaporate the filtrate to saturation point. Allow 15 minutes cool and then filter out the crystals of sodium chloride  
ii) I. A – Compression  
B – Fractional Distillation  
II. to absorb/ remove carbon (iv) oxide gas /  $\text{CO}_2$  (g)
- To dry the gas mixture to remove water vapour.
2. a) i) Propan – 1- ol/ Propanol  
ii) Propanoic acid  
b) i)  $\text{C}_n \text{H}_{2n}$   
ii) 70  
iii)  $5 \times 12 + 2n = 70$   
 $60 + 2n = 70$   
 $2n = 70 - 60$   
 $n = 5$   
c) Step I  
Hydrogen ./ Nickel catalyst  
Step II  
Hydrogen chloride  
Step III  
1 – chloroethene  
ii)  $4\text{CH} = \text{CH} + 5/2 \text{O}_2(\text{g}) \rightarrow 4 \text{CO}_2 + 2\text{H}_2\text{O}$   
Penalise  $\frac{1}{2}$  for wrong or missing symbols  
Award zero of  
iii) Continued use of product formed in a step III  
Pollutes environment since they are non biodegradable
- 3 a) i) A – Hot compressed Air of 15 atmospheric  
Pressure: to produce height fourth  
Consisting of a mixture of molten sulphur and water  
C- Super heated water at  $170^\circ\text{C}$  to ensure that the water remains in liquid state at the high temperature  
II I – Transition temperature  
II – Rhombic are bright yellow crystalline solid with an octahedral shape, while monoclinic are pale yellow crystalline solid, which appear needle like shaped  
b) i) - Zinc blende ( $\text{ZnS}$ )  
- Copper pyrites ( $\text{CuFeS}_2$ )  
- Galena ( $\text{PbS}$ )  
ii) - Dust particles

- Water vapour in the air
- iii) They reduce the surface area of the catalyst, thus impairing its efficiency
- C i) I Lowers the production of  $\text{SO}_2(\text{g})$  ( sulphur (iv) Oxide). This is because the reaction is exothermic. Increase in temperature disturbs the dynamic equilibrium. Such that it shifts to the left favouring more production of products.
- ii) Lowers the production of  $\text{SO}_2$  gas . This is because a decrease in pressure disturbs the dynamic equilibrium where by it favours the direction of the reaction that forms more molecules
- r
- iii) Vanadium (V) oxide. This is because it is not expensive and not easily being poisoned.
- iii)  $\text{SO}_2$  gas react with rain water to form acidic rain fog which causes
  - Stunted growth in plants due to loss of chlorophyll from plants
  - Death of plants as a result of defoliation
  - Destruction of aquatic life in acidified lakes
  - Leading away of mineral salts from the soil
  - Irritation of the respiratory system, thus worsening respiratory illness

- 4
- a) i) K or L any correct  
ii) Abundant in earths crust - Reacts with water from alkaline solutions
  - b) F has a bigger atomic radius. Across the period nuclear charge increases while electrons are being added in the same energy level.
  - c) C and I
  - d)  $\text{D} \rightarrow \text{D}^{2+} + 2\text{e}^-$
  - e) i)  $\text{DBr}_2$  ii)  $\text{C}_2\text{SO}_4$
  - f) i) Ionic  
ii) Covalent
  - g) J is bigger than I. the bigger the molecule the stronger the intermolecular forces of attraction
  - h) i) Energy required to remove the 1<sup>st</sup> electron from an atom in gaseous state  
ii) The 2<sup>nd</sup> electron is being removed from a stable energy level/ any energy level closer to the nucleus the first electron being removed from the outermost energy level  
iii)  $420 + 3100 + 4800 = 8320 \text{ K /Mol}$
- 5.
- a) i)  $\text{Al}_2\text{O}_3 \cdot 2\text{H}_2\text{O}$   
ii)  $\text{Al}_2\text{O}_3 + 2\text{NaOH aq} + \text{H}_2\text{O} \rightarrow 2\text{NaAl(OH)}_2$   
iii)  $\text{SiO}_2$   
iv) Seeding Some  $\text{Al}_2\text{O}_3$  added Some  $\text{CO}_2$  bubbled through  $\text{NaAl(OH)}_4$  to precipitate out  $\text{Al(OH)}_3$
  - b) Lower melting point of electrolyte  
- Improve electrolytic properties of  $\text{Al}_2\text{O}_3 (\text{g})$
  - c) Anode
 

$2\text{O}^{2-} (\text{l}) \rightarrow \text{O}_2(\text{g}) + 4\text{e}^-$   
 Cathode  
 $\text{Al}^{3+} + 3\text{e}^- \rightarrow \text{Al}(\text{g})$
  - d) Low density  
- Does not corrode easily

6. a) i and ii  
 b)  $0.80 - 0.34$   
 $0.46$
- c) (i)  $\text{Ag}^+ (\text{aq})$  reject Ag  
 ii) Zn reject  $\text{Zn}^{2+}$
- d) (i)  $\text{Zn}(\text{s}) \rightarrow \text{Zn}^{2+} (\text{aq}) + 2 \text{e}^-$   
 (ii)  $\text{Zn}(\text{s}) + \text{Pb}(\text{aq}) \rightarrow \text{Zn}^{2+} (\text{aq}) + \text{Pb}(\text{s})$   
 (iii) Maintains the balance of ions in the two half cells  
 Completes the circuit
- e) i) To remove any oxide layer  
 (ii) a) Q = Its  
 $= 0.75 \times 64 \times 60$   
 $= 2880 \text{c}$
- b)  $\frac{0.52}{52} = 0.01 \text{ moles}$
7. a) i) Reactants \_\_\_\_\_ M  
 Production \_\_\_\_\_ T

$$20 \text{g} \xrightarrow{1} 40 \text{g} \xrightarrow{2} 60 \text{g} \xrightarrow{3} 80 \text{g} \xrightarrow{4} 100 \text{g} \xrightarrow{5} 120 \text{g}$$

No of half lives = 5

$\therefore (1/2)^n \times \text{original Mass} = \text{Remaining Mass of the substance}$

$$(1/2)^5 \times Y = 3.5$$

$$(\frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2} \times \frac{1}{2}) \cdot Y = 3.5$$

$$(1/32 \cdot Y) = 3.5$$

$$Y = 32 \times 3.5$$

$$= 112 \text{ g}$$

I Step I Alpha (\*\*\*) particle

II Step II Beta (β) Particle

II - The equation for the nuclear reaction

210

C i)  $\text{DH}_1$  – Heat of atomization

ii)  $\text{DH}_3$  – Heat of reaction

iv) -  $\text{DH}_1 + \text{DH}_2$
